PyQuest

Brought to you by: Ana Maria Martinez, Angel Duarte,
Jaqueline Lizeth Lopez, Jennifer Mesa, and Julian Novak

What is PyQuest?

- A beginner-friendly mobile app that teaches kids basic Python coding
- Uses a simple login, level selection, and structured lessons designed to reduce fear of coding
- Built in Unity and VS Code for clear visuals and easy navigation, the app delivers an accessible learning experience for young first time coders.

Problems to Solve

- Technology is advancing faster than ever, yet many schools do not prioritize early coding education or other technological foundational skills.
- Schools often lack age-appropriate resources to introduce programming concepts.

About Our Demo

Requirements:

- Login
- Level Selection
- Lessons
- Quizzes
- Progress tracking

What does success mean for us?

A functional demo where users can complete at least one full lesson and quiz.

 **Hello, World!**
The print() Function

In Python, we use print() to show messages on the screen. It's like teaching the computer to talk! Whatever you put inside the parentheses () will appear on your screen.

<> Example Code:

```
print("Hello, World!")  
print("I love coding!")  
print("Python is fun!")
```

💡 Tip:
Always put your message inside quotes " " so Python knows it's text!

Ready to test what you learned? Defeat the monster with your new knowledge!

 **Fight the Monster!**

About Our Demo

PyQuest's educational flow algorithm ensures lessons unlock only after successful quiz completion

PyQuest is a Unity 2D game built in C#, using Unity's scene system to control how the player moves through different parts of the game.

System Overview

- The app is structured using multiple Unity **Scenes** such as Login, Main Menu, Level Select, Level 1, etc.
- Character movement, animations, and interactions (like opening treasure chests) are handled through **C# scripts**.
- Level layouts are created using **Tiled** and imported into Unity using the **Tiled2Unity / SuperTiled2Unity** workflow.

Implementation notes

- We use Unity's 2D tools for all movement, collisions, and animations.
- Code is organized by feature: Player movement script, Chest interaction script, Quiz system script, Level loading script, etc.
- Each scene has its own GameObjects and scripts to keep the project simple and easy to understand.
- All logic runs locally in Unity — no external server or database is required.
- Sprite animations are controlled using the **Unity Animator**, and transitions depend on player input and movement.
- Tiled maps are imported into Unity and used to design levels quickly without manually placing tiles one-by-one.

Security, Privacy, Accessibility

- No user data is stored externally; only temporary in app variables are used.
- To improve accessibility, PyQuest uses large fonts, high-contrast colors, and simple language for children.
- PyQuest does not use external API's, networking, or intake personal data, to ensure safety for minors

Limitations

- Currently, PyQuest only supports a few lessons
- There is no long-term data saving yet (Player progress resets each time unless we add file-based saving).
- We prioritized functionality while developing our demo, animations and art are still simple.

Our Goals for the Future

- Add more levels, puzzles, and Python lessons.
- Create boss battles for each level as originally planned.
- Add simple cloud or file saving so kids can return to where they left off.
- Improve sprite animations and add cutscenes or character dialogue.
- Expand to more platforms (Windows, Android, iOS) using Unity's build tools.

Thank You!
