

Shortcomings/Wishlist Document

There were several planned stories and product owner requests that were not implemented fully/at all. The list is here below:

- Implement API requests through Express.js to save content creation features to MongoDB database (i.e., multiple-choice, drag-and-drop, interactive video)
- Implement session saving features using existing system for all interactive content—this is to ensure content is saved to instructor accounts
- Implement saving features to student accounts as well (i.e., progress reports, saved quizzes and content)
- React.js UI fixes with content creation and overall website design
- Improve “Create Content” tab and related interactive content to facilitate a better user experience for both instructors and students
