

NuMom

Spring 2023 Capstone II Project

Poster by: Vanya Farzamipour

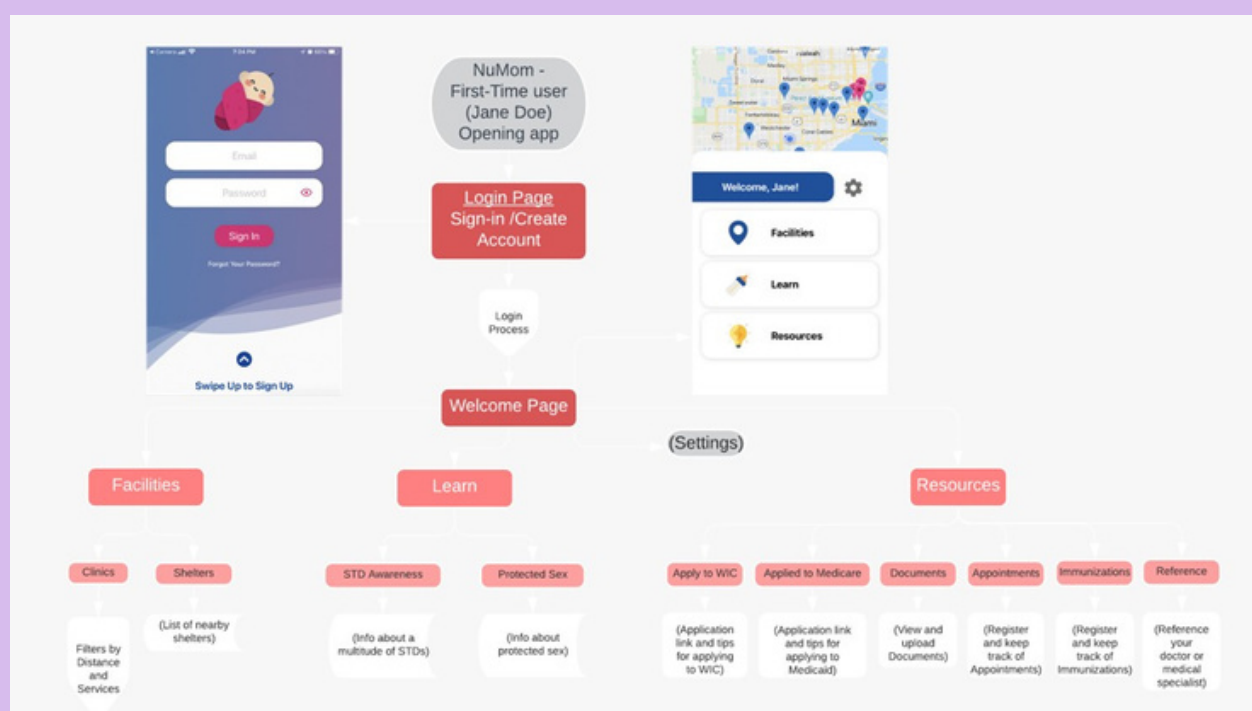

Problem

Low income mothers often have a lack of resources in order to properly care for themselves and their children. NuMom is an app that aids these mothers such as, being informed (STDs/ child care) & finding proper medical care in their area.

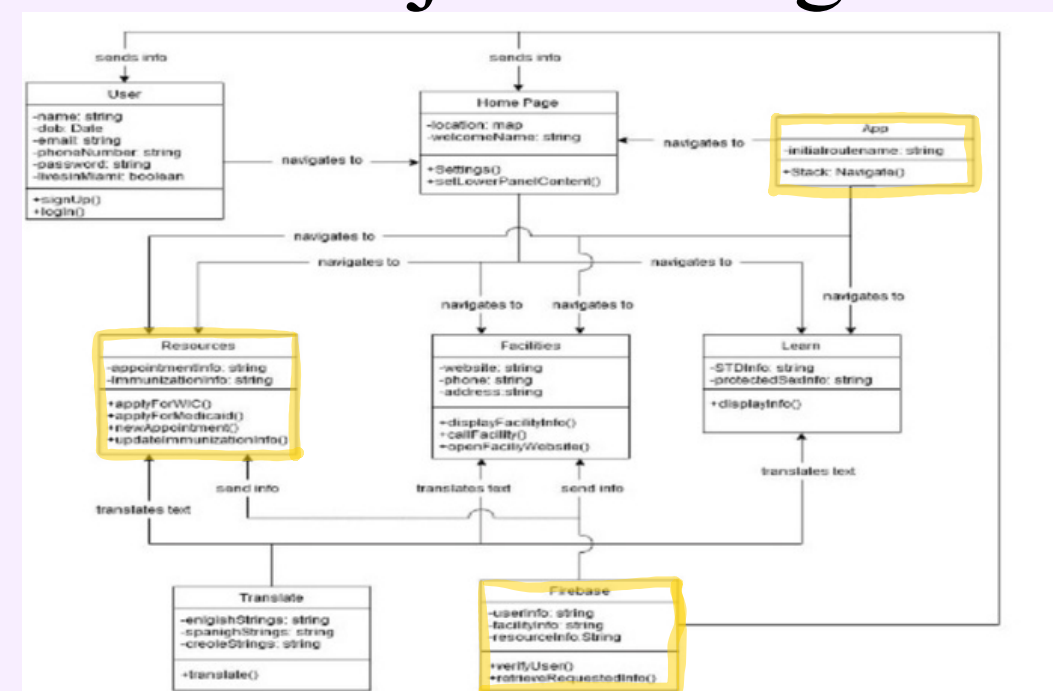

Features

- being able to create an account & login using saved info
- locating clinics based on location
- saving important medical documents in your account
- in depth information on STDs & sex education

System Design

Object Design

Contributions/Summary

Being the team lead in this project, a main portion of my responsibility was making sure the scrum ceremonies are being performed effectively & consistently. As well as making sure my team members & I were on track with our progress & coordinating with all the group members daily. Communicating with the product owner was also a priority in order for us all to communicate our progress/ideas well. I also contributed to the development as well with condensing information, getting rid of unused imports, & updating the project version to make the demo work with the simulator

Implementation
