

Add Security Features to Protect Users Info

Adding security features that prevent malware and the expose of user's information was not something that came into the development process. We now realize the risk this leads towards users and would like to include more security features such as two step verification and some form of protection towards entry of the back end of the app.

Basic App Function

Implementation of a dark mode in the application can further enhance the user experience while also having a better dynamic look with other operating system themes. Recover password, for users to change passwords. A settings feature that allows user to manipulate the layout and functions of the app on a basic level. A more in depth messaging system that allows for video and images.

User Terms of Service

This is another feature we are in the process of developing, the legality of what users can do and the negative effects that it could have on the developer as well as the user. We hope to implement solid terms and conditions that provide safe use of The University Social App.

An Authentic Connection

As one of the main functionalities of the app was to be able to match with other users and message one another, it was purely based on who showed up first. Rather than based on major, similar interest, proximity locations all features we would like to include.
